AN ORDINANCE OF THE SOUTH WEBER CITY COUNCIL AMENDING CITY CODE SUBSECTIONS 11.04.020.J.6, 11.04.040.B AND 11.04.140 REGARDING STREET LIGHT INSTALLATION AND COLLECTOR STREET RIGHT OF WAY WIDTH

WHEREAS, after extensive study by the Municipal Utilities Committee and based upon its findings and recommendation presented to the City Council on November 13, 2018, the Council determines it to be in the best interest of the City to select their own contractor to manufacture and install new street lights, rather than continuing with the practice of having the Power Company install them; and to correct the minimum collector road right of way width from 76 feet to 78 feet; and

WHEREAS, the Planning Commission held a public hearing on January 29, 2019 and recommends its approval to the City Council; and

WHEREAS, various amendments and technical changes need to be made to certain sections of the City Code to incorporate the proposals;

1. Major Streets: 110 feet;
2. Collector Streets: 78 feet; and
3. Local Streets: 70 feet;

except where existing conditions do not permit the minimum width, sidewalk requirements may be adjusted to allow a road width of not less than 41 feet from top back of curb to top back of curb.

Section 3. Section Amended. Section 11.04.140 of the South Weber City Code is hereby amended to read:

11.04.140 Street Lighting

B. The placement and installation of street lighting shall be in accordance with adopted City Standards.
C. The subdivider shall be required to get power installed into the subdivision and notify the City when power is available.

APPENDIX A – STORM DRAIN AND DRAINAGE DESIGN STANDARDS

APPENDIX A

STORM DRAIN AND DRAINAGE DESIGN STANDARDS

A1. General Provisions

A. South Weber faces unique storm water challenges because the City is surrounded on two sides by mountains and has the potential to receive a large amount of runoff in a short time. South Weber also has a relatively large amount of property that has not yet developed, but is likely to develop into residential housing, commercial, or industrial uses, thus increasing the amount of impervious surfaces leading to increased runoff.

B. This document represents the design and construction standards for private and public design and construction as it relates to storm drainage within the City. All efforts have been made for this policy to conform to the requirements of the Clean Water Act, Phase II; and the Storm Water Management Plan of the City.

C. The following information is organized in such a way to follow the natural flow of storm water – from the initial rainfall hydrology (A2), to conveyance of the rain water (A3) to a basin (A4), then discharge to a natural outlet location (A5).

A2. Rainfall Hydrology

A. All storm drain systems shall be designed to carry the 100-year storm, unless otherwise stated.

B. Storm Specifications

1. Local storm drain piping shall be designed for the 10-year storm, where the road or other above ground conveyance will carry the difference to the 100-year storm.
2. All basins regardless of local or regional, or retention or detention, shall be designed to accommodate a 100-year storm event, including all piping into the basin.
3. The storm duration used for the sizing of basins shall be based upon the worst case scenario and not the time of concentration.
4. Volume in pipes, ditches, or roadside swales shall not be considered in the volume calculation for detention and retention basins.

C. Rainfall Intensity – When using the Rational Method, use the rainfall intensity table included as Exhibit 1 to this document.

D. Calculation Basis – For developments less than 20 acres, the Rational Method may be used. For developments larger than 20 acres, a City Engineer-approved computer model shall be used.

E. Rainfall Pattern and Depth – For the use of computer models, the following rainfall pattern shall be used. This pattern is based on the Farmer-Fletcher Distribution. This pattern is for a

1-inch unit storm and must be multiplied by rainfall depth for storms of other magnitudes, as provided in Exhibit 2.

A3. Storm Drain System

A. Independent System

1. Storm waters shall not be conveyed in irrigation ditches.

2. Irrigation waters shall not be conveyed in storm drain systems.

B. Piping – Storm drain lines shall be reinforced concrete pipe (RCP), of appropriate class. Minimum size for storm sewer mains shall be 15-inch diameter. Pipe specifications are included in the Section 5 of the Development, Design, and Construction Standards. Where determined by the City Engineer and/or the Storm Drain Capital Facilities Plan, larger drain lines shall be installed to accommodate future development. The cost to provide adequate storm drainage to a development shall be paid for by the Developer. Upsizing will be coordinated at the time of development. The cost of upsizing will be the responsibility of the City.

C. Access – Storm drain lines shall have cleanout boxes, inlets, or manholes installed at all changes in grade or alignment, with a maximum distance of 400 feet between accesses. Structures shall be installed in accordance with the standard specifications and standard drawings.

D. Sump Drains are not allowed except as approved by the City Engineer on a case-by-case basis. Proper permitting is required.

A4. Detention and Retention Basins

A. Definitions

1. Detention Basin – An open water storage pond designed to store a volume of water that reduces the post-development peak runoff of a storm to the pre-development runoff rate or other rate as defined by the governing body. This is accomplished by the use of an outlet control which controls the rate of flow out of the pond into the receiving storm drain or water body. The basin is intended to drain the storm water within a period of time to make the volume available for the next storm event.

2. Retention Basin - An open water storage pond designed to store the runoff volume of a storm. The basin is intended to dispose of water through infiltration and evaporation within a period of time to make the volume available for the next storm event.

B. Storm drainage basins are required for all development; however, developments less than one (1) acre are not required to have detention except when determined by the City Engineer.

C. Location – Detention basins shall be located with convenient access for maintenance and repair by maintenance personnel. This generally means that the basin property has frontage along a public roadway.

D. Parking lots – Storage of water shall not be allowed in parking lots.

E. Underground Storage – Underground storage will be considered for private basins only.

F. All detention basin designs and calculations shall be reviewed by the City Engineer for approval.

G. Maintenance and Ownership

1. Private Basins – When approved, private detention basins shall be owned and maintained by the property owner.

2. Local Public Basins – Local detention basins shall be constructed by the developer. Following acceptance of the construction, the ownership, operation, and maintenance shall be conveyed to the City.

3. Regional Detention Basins – Regional basins shall be owned and maintained by the City, constructed according to the criteria herein, and approved of the City Engineer. Actual ownership and responsibility shall be specifically defined in the Owner's Dedication Certificates, Development Agreements, or by Deed.

H. Basin Easement and Access

1. Public Basins – The developer shall provide the City permanent access to any public basin.

2. Private Basin – The City shall be provided an easement for emergency access, operation, and/or repair for a private basin.

3. Access – Each basin shall be constructed with sufficient drivable access, outside of the basin, to any structure from a city street.

I. Detention and Retention Basin Elements

1. Side slopes – Side slopes shall not be steeper than 4:1 (horizontal to vertical).
2. Bottom Slope – The basin floor shall be designed so as to prevent the permanent ponding of water. The slope of the floor of the basin shall not be less than 1% to provide drainage of water to the outlet grate and prevent prolonged wet, soggy, or unstable soil conditions. The preferred minimum slope is 2%.
3. Freeboard – At least one (1) foot of freeboard is required (berm above the high water mark).
4. Spillways
    a. The spillway shall be designed to carry the 200-year storm flow minus the 100-year storm flow which is handled by the outlet control structure.
    b. Spillways shall introduce flows back into the pipe or stream downstream of the outlet control.
    c. Spillways shall include a maintained swale and drainage easement to a safe location.
    d. The spillway shall be designed to prevent erosion.
    e. All spillways shall be designed to protect adjacent embankments, nearby structures, and surrounding properties.
5. Ground Covers – The surface area of the basin shall be sodded. A minimum of 4-inches of top soil must be installed prior to sod placement. The basin shall be provided with an automated sprinkler system approved by the City Engineer.
6. Embankment (Fill) Construction – If a raised embankment is constructed for a basin (constructed with granular materials), it shall be provided with a minimum of 6-inches of clay cover on the inside of the berm to prevent water passage through the soil.
7. Excavation (Cut) Construction – If the basin is constructed primarily by excavation, then it may be necessary to provide an impermeable liner and land drain system when constructed in the proximity of basements or other below grade structures as determined by a geotechnical evaluation.
8. Multi-Use Basins – Basins may be designed as multi-use facilities when appropriate precautions are incorporated into the design. If amenities such as pavilions, playground equipment, volleyball courts, etc. are to be constructed within the water detention area of a basin, they shall be designed appropriately. Structures shall be designed for saturated soil conditions and bearing capacities are to be reduced accordingly. Restrooms shall not be located in areas of inundation. Inlet and outlet structures should

be located as far as possible from all facilities. No wood chips or floatable objects may be used in the area that will be inundated.

J. Detention Basins

1. Percolation – No reduction due to percolation for detention basins volumes shall be permitted.
2. Outlet Control – Private detention basins may have a calculated fixed orifice plate mounted on the outlet of the basin. Public detention basins shall have movable, screw-type head gates set at the calculated opening height with a stop block required to carry the maximum allowable discharge.
3. Low Flow Piping – The inlet and outlet structures may be located in different areas of the basin, requiring a buried pipe to convey any base flows that enter and exit the basin. (Cross gutters and surface flows are prohibited.)

K. Retention Basins

1. Retention basins must be specifically approved by the City Engineer.
2. Retention basins shall not be permitted within zones 1, 2, or 3 of any Drinking Water Source Protection Zone of any drinking water source.
3. An approved oil/sediment separator shall be installed upstream of retention basin.
4. Volume shall be based upon the 100-year, 3 hour storm. See Exhibits 1 and 2 for rainfall data.
5. Retention Basin Criteria – Retention basins may be permitted if the following conditions apply:
    a. The distance between the nearest City storm drain and the boundary of the development is greater than:
        i. 500 feet for subdivisions or 10 lots or less;
        ii. 1,000 feet for subdivisions greater than 10 lots.
    b. The basin is not located within a Hazardous Area (such as a steep slope) or some other sensitive area (such as a Drinking Water Source Protection Zone).
    c. Recommendation by the City Engineer.
6. Percolation Rate for Retention Basins
    a. A percolation test shall be performed by a licensed tester. The percolation test shall be performed at the elevation of the proposed grade of the bottom of the retention basin.
    b. Due to degradation of soils ability to percolate over time, only 80% of the percolation rate shall be used in the calculations for the retention basins.

7. Retention basins shall be designed to completely drain within 48 hours of the primary storm event.

A5. Discharge

A. Allowable Discharge Design

1. Calculations shall be based on the 100-year storm event.
2. Calculations shall be based on the total acreage of the development draining to the basin.
3. Pass-through of offsite drainage through the development will be allowed.
4. Discharge shall not exceed pre-development runoff with pre-development meaning the condition of the land prior to settlement.
5. Alternatively, a standard discharge rater of 0.1 cubic feet per second per total acre may be used.
6. Controlled discharge will be established as described in A4.H.5 of this document.

B. Water Quality

1. Long-term Best Management Practices (BMPs) shall be used to maintain, to the maximum extent practical, the quality of the water to the pre-developed condition.
2. Construction BMPs shall be implemented per the City's Storm Water Management Plan.

C. Discharge to Irrigation Ditches – No discharge shall be permitted to irrigation ditches and canals unless express written permission is obtained from the responsible ditch company or ditch owners.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.
